

## WHAT IS THE REASON FOR AN *OUTFITTER* ?

The ***OUTFITTER*** rifle has some features that make it different from other rifles similar in appearance to the competition; these can be summarized as follows:

**1- PRECISION LOTHAR WALTHER BARREL**, German manufacturing. These guns are of deserved reputation, are carefully made, straightened and polished by hand one by one to get a mirror bore to prevent the deposition of traces of copper ammunition.

These barrels provide a superb long-range grouping included with the 15 " Model with which we have obtained grouping less than 1 MOA.

**2- MONOBLOCK SYSTEM**: For the fixing of the barrel instead of the traditional welding cord for the economic single shot rifles with the breakage risk, we have a mechanized monoblock from used one piece solid block of alloy steel and tempered with a manufacturing tolerance of only two hundredths of a millimetre. For fixing monoblock to the barrel the classic silver welding system is not used as it provides heat and tension to the whole but a sophisticated system with patent pending thread.

This joint to the dovetail also screwed in makes that the barrel does not lose its intrinsic qualities and accuracy.

**3- INTERCHANGEABILITY**: The accuracy of the whole barrel-frame allows interchanging the barrels.

**4- FRAME**: The frame is also of tempered alloy steel prior mechanizing with close tolerances of two hundredths of a millimetre in the important dimensions. These frames are subject to verification and test of resistance to breakage reaching twenty tons without cracking. For its design classic aesthetic scheme has been used but with light lines which produces a feeling of strength and yet lightweight highly approve from hunters and shooters.

5-The **OUTFITTER** has four **SAFE** points:

**a) Closing safe**, if the barrel has not been closed completely it doesn't allow mounting the hammer.

**b) Transfer bar safe**, if the trigger has not been pressed on the gun can not make fire, so we can carry the rifle loaded, without mounting the hammer, and is perfectly safe, even a fall or striking on the hammer the rifle can not shoot

c) In cases where carrying the rifle with a mounted hammer this has a safe next to the trigger that allows us to release it quickly and quietly.

d) Although is not a specific safe, we have a fourth possibility, the transport safe for bush walking through areas where there is a risk that the hammer could get hooked on something and can be mounted by accident, we can make sure the button is in the locked position which prevents not only that you can pull the trigger, also can not mount the hammer accidentally or voluntarily until the button has not been put again on the "shooting" position.

**6- WILLIAMS SIGHTS:** The **OUTFITTER** is fitted with a quality metallic sight of the renowned American fibre optic firm WILLIAMS; these have available corrections from height and precision. For those who prefer TELESCOPIC scopes, the barrel is prepared to accept a standard base supplied with the rifle if requested.

**7- MODULAR STOCKS & FOREND:** The stock and forend are modular, there are two different forend and two stocks, a classic Monte Carlo Stock and other type, thumbhole with cheek piece.

All these parts are of high strength polymer, unlike the low-cost stocks constructed of polypropylene, ours are made of reinforced fibreglass polyamide. This makes them virtually indestructible and unaffected by the weather or cleaning products and oils.

It is available in different finishes: black, wood, carbon fibre, rubber touch, etc...

The buttstock is a very soft elastomer material that absorbs 25% of recoil rather than a standard buttstock.
